

Help the wastewater make it to the treatment plant while avoiding clogs!

Our team works diligently to monitor and maintain our lines in order to prevent clogs and backups that can affect customers, but we look to our customers to do their part to prevent problems too! When it comes to what to flush, remember the three P's: pee, poo & (toilet) paper. These three things are designed to break down during the treatment process and keep things flowing as they should.

Sinks and other drains can also be culprits of clogs. A good rule of thumb is to keep fats, oils and grease (commonly referred to as FOG) out of your drains. These products don't break down, even when you run your garbage disposal, and clogs can send untreated wastewater backwards into homes.
